Ig lambda chain V-IV region - human (tentative sequence) (fragments)
N; Alternate names: amyloid-fibril protein GIL
C; Species: Homo sapiens (man)
C; Date: 01-Dec-1989 #sequence_revision 01-Dec-1989 #text_change 31-1
C; Accession: S02083
R; Fykse, E.M.; Sletten, K.; Husby, G.; Cornwell III, G.G.
Biochem. J. 256, 973-980, 1988
A; Title: The primary structure of the variable region of an immunog.
A; Reference number: S02083; MUID:89134210; pMID:3146981
A; Accession: S02083
A; Molecule type: protein
A; Residues: 1-70;71-72;73-75;76-131;132-146 <FYK>
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
F;14-88/Domain: immunoglobulin homology <IMM>

Scoring table:

BLOSUM62 Gapop 10.0 ,

```
No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Search time 11.6165 Seconds

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB seq

                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes human Apo-2 can be used CC therapeutically to induce apoptosis in mammalian cells, and so is useful CC to treat conditions associated with decreased apoptosis e.g. cancer. CC Apo-2 is believed to be a new tumour necrosis factor (TNF) receptor CC (TNFR). TNF cytokines can induce apoptosis, thought to be initiated by CD binding to TNFRs, and Apo-2 triggered caspase-dependent apoptosis. It CC can be used to identify agents activating Apo-2, useful to treat CC mammalian cancer cells, and to produce Apo-2 chimeras useful CC therapeutically (e.g. those containing immunoglobulin sequences can be CC inhibit apoptosis) or diagnostically (e.g. those comprising an epitope CC antibodies). It can be used to produce antibodies which can be combined CC with a (particularly pharmaceutically acceptable) carrier in compositions or used to produce dimeric molecules (especially homodimeric molecules CC comprising first and second Apo-2 antibodies). Agonistic (especially CC single-chain) antibodies can be administered to induce apoptosis in CC mammalian cancer cells, and antagonistic antibodies used to block CC excessive apoptosis (e.g. in neurodegenerative diseases). Apo-2 CC antibodies may also be used diagnostically e.g. to detect Apo-2 CC expression in cells/tissues and in Apo-2 antibody, designated 20E6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

It is believed that Apo-2 is a member of the tumour necrosis factor receptor (INFR) family. Apo-2 polypeptide is capable of triggering caspase-dependent apoptosis and activating nuclear factor-kappa B. A soluble extracellular domain of Apo-2 hinds Apo-2 ligand (Apo-2L). Apo-2 antibodies may be used to activate or stimulate apoptosis in cancer cells. They are therefore especially useful in the treatment of cancer to enhance immune-mediated cell death in cells expressing Apo-2, to detect expression of Apo-2 in specific cells, tissues or serum, and in affinity purification of Apo-2 from recombinant cell culture or natural

                                                                                                                                                                                                                                                                                                                                                                              The invention describes a novel isolated Apo-2 polypeptide. The Apo-2 polypeptide is useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, in quantitative diagnostic assays, as a control against samples containing unknown quantities of Apo-2, in generating antibodies, in affinity purification techniques, and in competitive-type receptor binding assays when labelled with, for instance, radioiodine, enzymes, or fluorophores. Nucleic acids encoding Apo-2 may be used as a diagnostic for tissue-specific typing. This is the amino acid sequence of the single chain antibody fragment (svFv) 20E6 used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             15-MAY-1997;

                                                                                                                                                                                                                                                                        The present invention describes human Apo-2 can be used CC therapeutically to induce apoptosis in mammalian cells, and so is useful to treat conditions associated with decreased apoptosis e.g. cancer. CC Apo-2 is believed to be a new tumour necrosis factor (TNF) receptor CC (TNFR). TNF cytokines can induce apoptosis, thought to be initiated by binding to TNFRs, and Apo-2 triggered caspase-dependent apoptosis. It CC can be used to identify agents activating Apo-2, useful to treat CC therapeutically (e.g. those containing immunoglobulin sequences can be inhibit apoptosis) or diagnostically (e.g. those comprising an epitope CC inhibit apoptosis) or diagnostically (e.g. those comprising an epitope CC with a (particularly pharmaceutically acceptable) carrier in compositions CC or used to produce dimeric molecules (especially homodimeric molecules comprising first and second Apo-2 antibodies). Agonistic (especially CC single-chain) antibodies can be administered to induce apoptosis in CC mammalian cancer cells, and antagonistic antibodies used to block CC excessive apoptosis (e.g. in neurodegenerative diseases). Apo-2 CC expression in cells/tissues and in Apo-2 antibody, designated 16E2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                 The present sequence represents a single-chain Apo-2 antibody, designated 16E2, which is isolated from a phage library. It is believed that Apo-2 is a member of the tumour necrosis factor receptor (TNFR) family. Apo-2 polypeptide is capable of triggering caspase-dependent apoptosis and activating nuclear factor-kappa B. A soluble extracellular domain of Apo-2 binds Apo-2 ligand (Apo-21). Apo-2 antibodies may be used to activate or stimulate apoptosis in cancer cells. They are therefore especially useful in the treatment of cancer, to enhance immune-mediated cell death in cells expressing Apo-2, to detect expression of Apo-2 in specific cells, tissues or serum, and in affinity purification of Apo-2 from recombinant cell culture or natural

Sequence

309

The invention describes a novel isolated Apo-2 polypeptide. The Apo-2 polypeptide is useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, in quantitative diagnostic assays, as a control against samples containing unknown quantities of Apo-2, in generating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                can be used to identify agents activating Apo-2, useful to treat mammalian cancer cells, and to produce Apo-2 chimeras useful therapeutically (e.g. those containing immunoglobulin sequences can be inhibit apoptosis) or diagnostically (e.g. those comprising an epitope tag polypeptide allow Apo-2 detection and purification using anti-tag antibodies). It can be used to produce antibodies which can be combined with a (particularly pharmaceutically acceptable) carrier in composition or used to produce dimeric molecules (especially homodimeric molecules comprising first and second Apo-2 antibodies). Agonistic (especially single-chain) antibodies can be administered to induce apoptosis in mammalian cancer cells, and antagonistic antibodies used to block
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 therapeutically to induce apoptosis in mammalian cells, and so is used to treat conditions associated with decreased apoptosis e.g. cancer Apo-2 is believed to be a new tumour necrosis factor (TNF) receptor (TNFR). TNF cytokines can induce apoptosis, thought to be initiated binding to TNFRs, and Apo-2 triggered caspase-dependent apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                excessive apoptosis (e.g. in neurodegenerative diseases). Apo-2 antibodies may also be used diagnostically e.g. to detect Apo-2 expression in cells/tissues and in Apo-2 purification. The present sequence represents a single chain Apo-2 antibody, designated 24C4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 14; Fig

Apo-2 polypeptide is capable of triggering caspase-dependent apoptosis and activating nuclear factor-kappa B. A soluble extracellular domain of Apo-2 binds Apo-2 ligand (Apo-2L). Apo-2 antibodies may be used to activate or stimulate apoptosis in cancer cells. They are therefore especially useful in the treatment of cancer, to enhance immune-mediated cell death in cells expressing Apo-2, to detect expression of Apo-2 in specific cells, tissues or serum, and in affinity purification of Apo-2 from recombinant cell culture or natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     24C4,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a novel isolated Apo-2 polypeptide. The Apo-2 polypeptide is useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, in quantitative diagnostic assays, as a control against samples containing unknown quantities of Apo-2, in generating antibodies, in affinity purification techniques, and in competitive type receptor binding assays when labelled with, for instance, radioiodine, enzymes, or fluorophores. Nucleic acids encoding Apo-2 may be used as a diagnostic for tissue-specific typing. This is the amino acid sequence of the single chain antibody fragment (svFv) 24C4 used in the preparation of anti-apo-2 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New Apo-2 polypeptides and polynucleotides, useful for inducing apoptosis in mammalian cells, in vivo or ex vivo gene therapy, quantitative diagnostic assays, or in generating antibodies aga
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Apo-2; tumour necrosis factor family; TNFR; generapoptosis; tissue-specific typing; affinity purcompetitive-type receptor binding assay; mouse;

                                                                                                                                                                                                                                                                                       antibody or its binding fragment having a first hypervariable region. The cepitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells in a patient, cell-cell, cell-matrix, platelet-matrix, for increasing mortality of tumour or leukaemia cells, for increasing mortality of tumour or leukaemia cells, for increasing mortality of diseased cells to damage by anti-disease, anti-cancer cor anti-leukaemia agents, or for decreasing the number of tumour or leukaemia cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and confirmation diseases such as cancer, leukaemia, autoimmune diseases, confirmation, retinopathic diseases and other diseases mediated by abnormal content of the invertions. This sequence represents a human antibody is protein-protein interactions. This sequence represents a human antibody
                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10
